

Photothermal solar container form

Overview

Here we report an organic high-temperature photothermal material (BTDyA) featuring the extended donor-acceptor-donor structure through ethynyl group π -bridges connection (D--A--D). However, most PCMs have a low photothermal conversion capacity and are prone to leaks. To address these two key issues of PCMs, fine modification and mineral encapsulation have been employed and demonstrated to be effective methods. This review summarizes the structure of mineral materials and. Photothermal conversion, the most direct pathway for solar utilization, has garnered widespread attention and made great advances. In recent years, organic high-temperature photothermal materials have demonstrated significant application potential for their properties of substantially surpass the.
