

Pumped storage project examples

Overview

For example, in Europe, the Obervermuntwerk II project in Austria and the Nant de Drance project in Switzerland are notable examples of new PSH installations that leverage advanced technologies to enhance efficiency and capacity. Pumped storage projects move water between two reservoirs located at different elevations (i.e., an upper and lower reservoir) to store energy and generate electricity. Generally, when electricity demand is low (e.g., at night), excess electric generation capacity is used to pump water from the. Pumped storage hydropower (PSH) is a type of hydroelectric energy storage. It is a configuration of two water reservoirs at different elevations that can generate power as water moves down from one to the other (discharge), passing through a turbine. The system also requires power as it pumps water. The Snowy 2.0 pumped storage project involves linking the existing Tintangara and Talbingo dams. (Credit: Snowy Hydro Limited) In February it was announced that Hitachi Energy has completed and handed over to Austrian power generator Verbund the world's first static frequency converter (SFC). There are 41 utility-scale hydroelectric plants currently online in the USA that have reversible pump/turbines, and qualify as part of a pumped storage project. Some of them are on rivers with multiple dams, allowing water to be pumped back upstream for water supply control, as well as. Growing energy demand while existing resources age and retire; pumped storage could help meet some of this need
